

NASA Expedition

By Jyotsna

Adults say that money doesn't grow on trees! Do you know how much money is being used every time we send a space shuttle out to explore space? According to www.spacedaily.com/news it costs twenty billion dollars to put a man on the moon! I think that NASA can do space research spending less money. All they have to do is make robots. These robots will make perfect substitutes for humans. Well, maybe it's not as easy as I just made it sound! This experiment would be much safer, cost a lot less money, and wouldn't need as much specialized materials like space suits, food etc. You wouldn't have to worry about sending the astronauts to space. The robots can take pictures, move around to your every command, and can perform almost all the activities a man can do. That way everyone, even kids could see the marvelous phenomena in outer space and interact with it. These special robots can be controlled by humans from Earth who would be wearing camera glasses so they could see everything the robot could see, except they wouldn't be able to touch it. This is a great idea not only would NASA spend less money, but we would have more money for other important things!
